

BYOWNERHUB NETWORK

SEO Strategy

A full-stack organic growth plan for fsbo.byownerhub.com and the 40-site network — covering technical infrastructure, keyword targeting, content strategy, E-E-A-T, cross-network interlinking, and a 90-day execution roadmap.

Prepared June 2026 · Internal working document

SECTION 1

Technical Foundation — What's Already Built

The technical SEO infrastructure is strong for a site at this stage. Most FSBO competitors launch without any of the following — this is a meaningful head start.

Dynamic sitemap	~1,400 URLs auto-generated: 101 metros, 782 suburbs, 30 state guides, 236+ blog posts, 4 Spanish landing pages, static pages.
Schema markup	HowTo + FAQPage + BreadcrumbList + Organization + WebSite on every page. Metro-specific MLS names in HowTo steps (MLS PIN, NTREIS, ARMLS, etc.).
Canonical URLs	Set on every page. Prevents duplicate content issues across suburb/metro overlap.
OpenGraph metadata	Title, description, and OG image on all pages. Affects CTR from social sharing.
hreflang	Canadian metros and 4 Spanish landing pages tagged correctly.
IndexNow	Wired for Bing, DDG, and Yandex. Pages discovered faster after each deploy.
Trailing slash	Consistent across all URLs. Eliminates a common duplicate-content source.
Content depth	101 metros with hand-tuned per-city data — median price, avg commission, MLS name, attorney required. 30 state guides with state-specific law, forms, and edge cases. Not templated filler.

SECTION 2

The Competitive Reality

You are not ranking for 'FSBO' or 'sell home without agent' in the near term. Zillow, Realtor.com, Redfin, and Bankrate hold DA 80-90+ with millions of backlinks. Your DA is likely in single digits as a new site. The strategy routes around them, not through them.

The correct frame is not 'compete with Zillow' — it's 'own the queries Zillow doesn't bother with.' Zillow dominates head terms but systematically ignores suburb-level FSBO queries, state-specific form searches, and comparison queries. That is where a focused content network can rank in months, not years.

SECTION 3

Keyword Hierarchy — Where to Actually Compete

Tier	Timeline	Sample Queries	Competition
Tier 1 (Stretch)	12-18 mo	'FSBO Dallas', 'sell home without agent Chicago', 'for sale by owner Phoenix'	High — major portals
Tier 2 (Build toward)	3-9 mo	'Texas FSBO guide', 'sell house without realtor Florida', 'flat fee MLS California', '[state] seller disclosure form'	Medium — niche sites
Tier 3 (Beachhead)	1-4 mo	'Naperville FSBO', 'Plano sell without agent', 'Scottsdale home disclosure forms', '[suburb] FSBO guide'	Low — very few authoritative competitors
Tier 4 (Quick wins)	Weeks	'option period Texas FSBO', 'T-47 affidavit Texas', '6d certificate Massachusetts condo', 'MLS PIN flat fee Boston'	Very low — near-zero

The suburb pages are the fastest realistic path to organic traffic. 782 pages targeting low-competition local queries are already built and deployed. Tier 3 and Tier 4 queries are where first-page rankings happen first — accumulating engagement signals on those pages is what eventually unlocks Tier 2.

SECTION 4

Critical Gaps

4.1 GSC Sitemaps — Highest-leverage 30 minutes

None of the Cloudflare Pages sites have sitemap.xml submitted to Google Search Console. Google will eventually crawl them via discovery, but a submitted sitemap accelerates indexing by weeks — sometimes months on a new domain. This is the single highest ROI task in the strategy.

fsbo.byownerhub.com — sitemap submitted June 2026	DONE
car.byownerhub.com — sitemap submitted	DONE
closing.byownerhub.com — not submitted	TODO
flatfee.byownerhub.com — not submitted	TODO
frbo.byownerhub.com — not submitted	TODO
landlord.byownerhub.com — not submitted	TODO
inspection.byownerhub.com — not submitted	TODO
All other CF Pages sites (12+)	TODO

4.2 E-E-A-T Signals

Google's Helpful Content Update rewards demonstrated first-hand experience and expertise. The content on fsbo.byownerhub.com is genuinely accurate, but Google has no signals to confirm this. Three gaps:

- No bylines or author profiles anywhere on the site.
- No About page establishing who ByOwnerHub is and why their analysis is trustworthy.
- Organization schema has sameAs: [] empty — no social profiles linked.

Fix: Add author profile — even 'ByOwnerHub Editorial Team, specialists in owner-direct real estate transactions' with a brief bio. Create an About page. Link Twitter/X and LinkedIn from Organization schema. A few hours of work with measurable ranking impact.

4.3 Blog Stub Problem

blog.ts contains 475 post entries. Of these, 236 have written content. The remaining ~239 are stubs — slugs in the sitemap with no body text. At scale, stub pages signal thin content to Google and can suppress rankings across the entire domain. Three options:

- Write the remaining 239 posts — highest upside, each is a Tier 3/4 keyword opportunity.
- Add noindex to stubs until content is written — safe holding pattern.
- Remove stub URLs from sitemap, 301 to parent metro page — cleanest, lowest risk.

Recommendation: Noindex stubs immediately while writing content in batches of 20-30 posts. Priority order: Texas, Florida, California — highest search volume and most suburb pages deployed.

4.4 Core Web Vitals

FCP (First Contentful Paint) is 2.0s on mobile — above Google's 1.8s threshold for 'Good'. The cause is likely render-blocking CSS and unused Tailwind not being purged. Mobile-first indexing means this affects every page's ranking potential. Fixable with Tailwind purge configuration in next.config.

4.5 Analytics Blind Spot

Plausible analytics is not wired on most sites. Without traffic data you cannot see which suburb pages are getting impressions, which state guides are ranking, or which posts drive conversions. This data is also critical for affiliate reapplications — LendingTree and others rejected the network citing low traffic. GSC + Plausible data changes those conversations. Install on all sites immediately.

SECTION 5

Network Topical Authority — The Biggest Unrealized Asset

40 sites on ByOwnerHub properties collectively covering FSBO, flat fee MLS, closings, inspections, rental, probate, and commercial owner-direct constitute a genuine topical authority cluster. Google's topical authority model rewards sites that comprehensively cover a subject — and the ByOwnerHub network does this collectively. No single site demonstrates this breadth, but the network does.

The gap: cross-linking is too sparse. NetworkPromo components at page bottoms with 3-4 links function as footer widgets, not topical authority signals. Contextual inline links within body content carry far more weight.

The right model: contextual inline cross-linking

fsbo flat fee section	Link to flatfee.byownerhub.com in body copy. 'Use a flat fee MLS service — see our flat fee MLS comparison for 2026.'
fsbo closing section	Link to closing.byownerhub.com. 'The closing process has several key steps — our closing guide walks through each one.'
fsbo inspection mention	Link to inspection.byownerhub.com. 'Schedule a pre-listing inspection — find vetted local inspectors here.'
Bidirectional	flatfee.byownerhub.com must link back to fsbo. closing.byownerhub.com links to fsbo. Each site strengthens all others.
Do not add nofollow	These are your properties. Let PageRank flow freely between them. No nofollow on cross-network links.

The 40-site network becomes an SEO asset only if it's intentionally interlinked. Right now it's 40 separate sites that share a brand. With systematic contextual interlinking it becomes a topical authority cluster that signals deep expertise in owner-direct real estate.

SECTION 6

Content Strategy

What's working

- 101 metro pages with hand-tuned per-city data — not templated filler. MLS names, attorney requirements, and commission data differentiate this from thin aggregators.
- 30 state guides are substantively good. Texas guide covers TREC forms, option periods, T-47 affidavits, multiple MLS systems — expert content.

- 782 suburb pages are the Tier 3 beachhead. Near-zero authoritative competition on these queries.
- 236 written blog posts are real content. Each targets a specific Tier 3/4 query within its metro.

Content priorities (in order)

1. Resolve stubs	Noindex 239 stub posts within one week. Write in batches starting with Texas, Florida, California.
2. Author attribution	Add byline and bio to all state guides and blog posts. Single component change — applies across all 236+ written posts.
3. Suburb depth	Verify suburb pages have substantive content. Thin suburb pages are worse than no suburb pages.
4. Inline disclaimers	Add point-of-use disclaimer at each tool section. Footer disclaimer is not sufficient for E-E-A-T in a regulated industry.
5. Spanish content	4 Spanish landing pages are live. Expand to full metro pages for Houston and Miami — high-value audience with very low Spanish-language FSBO competition.

SECTION 7

Link Building

Backlinks are the hardest part of SEO in real estate. The strategy is not to out-compete on raw link count but to build a legitimate, topically relevant profile that supports suburb and state guide rankings.

State bar referral pages	Some state bar websites link to FSBO transaction resources. Low volume, high authority, topically relevant.
County assessor sites	Some county websites link to homeowner guides. Targeted outreach for the top 20 metros.
BiggerPockets community	Real estate investor forum with millions of members. Genuine answers to FSBO questions with links to relevant metro pages.
Reddit organic	r/RealEstate, r/FirstTimeHomeSeller, r/DIY. Contribute genuinely — link to metro pages when actually useful.
Personal finance blogs	'How to save money selling your home' is a common topic. Guest post outreach to 10-15 mid-DA blogs.
The network itself	40 sites linking to each other is the most controllable lever available. Build contextual cross-links before pursuing external outreach.
Local newspaper RE sections	Local papers publish FSBO guides seasonally. Pitch state guides as source material.

SECTION 8

Canonical Issue — flatfee.byownerhub.com

Flag: The flatfee-hub codebase sets canonical URLs to www.flatfeemlshub.com, not flatfee.byownerhub.com. If flatfeemlshub.com is a domain you own and intend as primary, this is correct. If you do not own flatfeemlshub.com, these canonicals are crediting a domain you don't control for your content. Resolve before the next deploy: confirm ownership of flatfeemlshub.com or update canonicals to flatfee.byownerhub.com.

Also noted: providers page metadata says '2024' — update to 2026. Stale year in meta description signals stale content and hurts CTR.

SECTION 9

90-Day Execution Roadmap

Period	Priorities	Expected Outcome
Week 1	Submit sitemaps for all CF Pages sites in GSC. Install Plausible on all sites. Noindex 239 stub blog posts. Resolve flatfee canonical conflict.	All sites indexable. Baseline traffic data starts.
Weeks 2-4	Add contextual inline cross-links across top 5 hub sites. Add author attribution to all state guides and blog posts. Create About page for byownerhub.com. Fill sameAs in Organization schema with social profiles.	E-E-A-T signals live. Network interlinking active.
Month 2	Fix Core Web Vitals — Tailwind CSS purge, FCP target under 1.8s. Write 30-40 blog posts for Texas and Florida metros. Audit suburb page content depth — flag thin pages. Verify inline disclaimers at each tool section.	Mobile rankings improve. 40+ new Tier 3 URLs indexed.
Month 3	Pull GSC data: which suburb pages have impressions? Which state guides? Double down on states getting traction. Write 30-40 more blog posts in top-traction states. Begin external link outreach (BiggerPockets, finance blogs).	First suburb page rankings. Affiliate reapplication data ready.
Month 3+	Apply for LendingTree, Rocket Mortgage with GSC traffic proof. Expand Spanish content to full Houston/Miami metro pages. Apply for Ezoic Access Now on fsbo.byownerhub.com.	Traffic unlocks affiliate approvals. Monetization layer activates.

SECTION 10

The Traffic-to-Monetization Unlock

The SEO strategy and monetization strategy are directly linked. Affiliate programs that rejected the network cited low traffic. GSC impressions and click data — even modest — is the proof that changes those rejections.

Ezoic Access Now	No traffic minimum. Apply as soon as Plausible shows any traffic. RPM \$5-25 vs AdSense \$2-8.
LendingTree affiliate	3 months of GSC + Plausible data is sufficient for reapplication.
\$99 ByOwnerHub Pro	Paywall revenue is independent of SEO traffic volume — but higher traffic means higher conversion volume. Suburb pages are the funnel top.
B2B lead monetization	FSBO seller leads worth \$40-100 to agents and title companies. Traffic data makes this a credible pitch to brokerages.

The technical infrastructure is in place. The content is substantive. The 40-site network exists. The gap between where the network is now and where it needs to be is not a question of what to build — it's a question of systematic execution on GSC submissions, content completion, E-E-A-T signals, and cross-network interlinking. None of these require new architecture. They require focused weeks of work.
